Right: Inxight TableLens allows users to spot relationships and analyze trends in tabular data, easily viewing and manipulating entire data sets.

Left: Inxight StarTree allows users to navigate and explore hierarchical relationships and drill-down to information of interest.

Inxight VizServer offers two great visualization tools for the exploration of large amounts of data or hierarchical clusters. In my experience as a visualization consultant, many companies were very interested in the so called hyperbolic tree (right hand). It is also amazing but it does not seem to be faster in navigation as a common file tree-browser. But for certain amounts of items it is a good tool especially when it is integrated into websites.

Best regards
